Customize toolbars First, the customer should create a toolbar object, which has the necessary properties. This requires writing a custom class and a registration script. This class then can be

registered to a toolbar in the Editor / Customize Toolbars dialog. First, create a custom toolbar object, which is a class that inherits from the AbstractToolbar class. The object has a few properties: Name: The name of the toolbar. Visible: Set to True to show the toolbar. Enabled: Set to True to be able to select the objects on the toolbar. Active: Set to True to show the toolbar as active when the user is on that drawing page.
