KEYMACRO Keymacro is a simple, yet powerful, tool for administering your network. With Keymacro, the network administrator does not need to use administrative tools to perform routine tasks such as remote control, enumerate connections and services, as well as making local modifications to the hosts and services. Keymacro enables network administrators to create schedules that define when the tool runs (the schedule is a simple list of days, hours, minutes and seconds). It can also be used to lock the running process so it cannot be stopped or restarted without entering the password. It is also possible to make this process run on a regular basis. KEYMACRO has several advantages over traditional solutions: When it comes to remote control, KEYMACRO can be used to perform long-running and complex administrative tasks, without the need to open a command window or a remote computer. It can manage a large number of hosts and services and can perform powerful modifications to them. For example, it can block or unblock any host or service, modify the TCP/IP settings or restart any host or service. The process can be enabled or disabled via scripts, giving the network administrator the flexibility to make the tool optional or available to specific hosts and services. KEYMACRO includes an extensive library of actions, which are available in its own folder. These actions can be configured via an XML file. KEYMACRO comes with its own remote tool, which can be used to perform most of the actions provided by the application. The main advantage of KEYMACRO is that it is simple to use, yet powerful. It comes with a friendly graphical interface and, thanks to the well-defined actions, it can be used to perform most of the tasks. KEYMACRO is included in the standard distributions of Windows, and can be run as a standalone application or a service. KEYMACRO allows you to check and manage hosts, users, services and hosts running under a virtual environment, such as a virtual machine. If the network administrator has installed multiple Keymacro servers, it is possible to manage them remotely. The server can be configured via an XML file that can be stored on a network share, a USB flash drive or a network share. KEYMACRO's configuration file can be edited using the Windows text editor, notepad. When it comes to network configuration and management, it is worth considering this simple yet powerful tool. KEYMACRO's advantages over other tools: It is an easy-

Windows MSI for the full package (MSI) MSI files are compact packages that contain all the files required to install a software. They are a perfect way to distribute your application and can be downloaded for free from most application portals. They come with a powerful redistributable package that installs all the required files, and they are compatible with all Windows versions. If you are not already familiar with MSI technology, then you should take the time to learn it. Read also : Queues in MSMQ: A Closer Look. Manage Queues with MSMQ. Windows Installation Files. What is an MSI File? MSI files are binary files that can be downloaded to a computer and installed to make the application work. They don't contain the application code, but all the files needed to install the application in its proper folder. This is the main advantage of MSI files. If you send an application file to a user, he will have to download it and install it on his computer, using a software package installer or manually. With MSI files, the user does not need to install the software himself. What is an MSI file? ### What's New In QueueExplorer Professional?

MSMQ Service (Windows Service) provides a set of libraries and the infrastructure for building applications that interact with, store and forward messages between computers using Microsoft Message Queuing (MSMQ) technology. The Service includes the msmq.exe utility that allows you to manage queues on a computer. In order to run the msmq.exe tool and manage queues, the following basic prerequisites are required: To install the Microsoft Message Queuing service on a computer, you must first install the Microsoft Message Queuing Client for Windows. To connect to a queue from a computer other than the one on which it resides, you must first make sure that the other computer has a connection to the queue on the computer on which it resides. After installing the Service, the computer's firewall must be configured to allow remote computer connections to the queue. ....
