What's New in the?

AutoGrammar is a command line utility that is very simple to use. It allows you to process a list of files or directories recursively, and then sort them by type, as well as execute a command on each of them. The program contains a small and very flexible command line interface, which allows you to execute the following functions: Sort files or directories by type and execute a command on each of them Execute a command on each of the files or directories in a list Generate a list of files or directories from a list Create, move, delete, copy or move directories Generate or append a file name to a list of files Sort files or directories by type and display it in a tree structure Add a folder to a tree structure and display it Display the content of a folder and all its sub-directories Generate a list of files from a folder Generate or append the name of a file Print files in a selected directory Execute or skip a command on a single file or directory Execute or skip a command on a list of files or directories Generate a list of all files in a directory List files in a directory List files in the selected folder and its sub-folders List files by size, modified date, etc. Search files by type, size, modified date, etc. List the contents of a directory Print the file name of a file or the type of a directory Move a file or directory The portable version of Random DNS Generator is designed to generate domain names and random IP addresses for domains, subdomains, and hostnames on your local network. The tool has a large number of options and settings which enable you to generate domain names in different languages, containing letters of any Latin alphabet, numbers, special characters (punctuation marks, '-', '_' etc.) You can include words, phrases, a random sentence or a specified amount of characters into the domain name. A feature that is unique to Random DNS Generator is the ability to generate several different types of domain names at the same time. In addition, the program enables you to add IP addresses to the domain name. You can choose the country, region, and language of the domain name. If you use it, Random DNS Generator will automatically generate a random number for each character of the domain name, which will be used to populate the IP address. The program is easy to use and does not require any software installation, so you can generate domain names directly from your computer. All you need to do is download the program and run it. Random DNS Generator is free to download and can be used without any restrictions. Random DNS Generator Features: SecureDNS is a free service that provides DNS protection using HTTPS protocol. It encrypts DNS requests so that they are sent over the Internet in an encrypted way

System Requirements:

Minimum: OS: Windows XP/Vista/7/8 Processor: Pentium 4, 1.6 GHz or faster Memory: 128 MB RAM Graphics: 256 MB DirectX: Version 9.0 or higher Recommended: OS: Windows 7 or higher Processor: 2.0 GHz or higher Memory: 256 MB RAM More information: Showcases Mentioned above
