Any mobile phone user would often need to root the particular device, in order to accomplish a number of objectives. For example, the simple tasks like customizing the look and feel of the phone, unlocking the bootloader (not mandatory for all), customizing the ROMs (rather, the custom ROMs), enabling the third party applications, etc. root So, it is only natural that there would be a ton of posts all over the web on how to root the devices. While rooting the device is certainly important, it is equally important to perform a battery test, just to be on the safe side. This is due to the fact that, rooting can be completely fluid which might cause a lot of damage to your device in the long run. Hence, it becomes extremely important to measure the battery life after rooting the device. This is often referred to as the benchmark test. Battery test All mobile phones have a battery capacity of one or more discharge cycles. So, unless you measure the

discharge cycle of the battery before and after the rooting process, you cannot be completely sure of the change in battery life. Of course, this would also depend on the device you are using. For example, many of the non-Apple devices like BB BOLDs are based on BBOS, which has a user-centric experience. This means that, the non-Apple operating systems are more popular than Apple's iOS. This would mean that, the battery life might be quite satisfactory in BBOS. However, BBOS is not as user friendly or as easy to operate as iOS. The actual battery testing is quite simple. After rooting the device, charge the battery to its minimum level and leave the phone to completely drain. This is so that you can measure the battery life of the device after rooting. It would be great if the time the device takes to drain completely could be displayed in the panel. This is also an optional measurement but might be very handy to monitor the battery life of the device. It is important to be sure that, you are not leaving the phone unattended
