A: I have solved this (thanks to previous posts): remove automatically generated.patch files (like.unpacked) delete the Repository folder (containing "repoview.log") change the path to repoview.log (based on the one downloaded from here: In that way the application is installed and can be used. # Add project specific ProGuard rules here. # By default, the flags in this file are appended to flags specified # in /Users/rui/Development/Android/sdk/tools/proguard/proguard-android.txt # You can edit the include path and order by changing the proguardFiles # directive in build.gradle. # # For more details, see # # Add any project specific keep options here: # If your project uses WebView with JS, uncomment the following # and specify the fully qualified class name to the JavaScript interface # class: #-keepclassmembers class fqn.of.javascript.interface.for.webview { # public *; #} Structural investigations of the influence of cell-substrate interactions on the formation of the epithelial bilayer. The epithelium of Sertoli cells is formed in vitro by L6 rat myoblasts, which are homologous to the myoepithelial cells of the seminiferous epithelium. The formation of the bilayer of Sertoli cells depends in part on a cell-substrate contact area, thus the cell:substrate adhesion provides a physical force for the epithelial differentiation. To define the chemical mechanism of cell:substrate contact area, the cell-substrate adhesion was studied both by biochemical and by immunocytochemical analysis. L6 rat myoblasts, when grown on a cell-adhesive monolayer of fibronectin, grew preferentially in the monolayer, with the formation of a continuous sheet of aligned cells. In contrast, when the myoblasts were plated on a laminin-coated substrate, only sporadic and uncoordinated cell contacts occurred, with the formation
