Investigation of the molecular basis of mental retardation in 3-methylglutaconic aciduria. To determine the molecular basis of the neurologic disorders in patients with 3-methylglutaconic aciduria (MGA), we have analyzed the glutamate dehydrogenase (GDH) and transhydrogenase (THD) genes from 4 patients with MGA. DNA isolated from the peripheral blood leukocytes of these patients was subjected to polymerase chain reaction amplification of exons in each of the GDH and THD genes. Each region was also sequenced to identify the presence of mutations. GDH and THD gene mutations were not detected in the 4 patients. We have previously shown that patients with MGA are characterized by hyperammonemia and cognitive delay, but clinical testing for other neurologic and other neurologic disorders were negative. Our current study raises the possibility that the neurologic syndromes in these patients are due to the presence of other undiscovered genetic defects.

Q: Representing a list as a graph using matrices, can I do this? I have some general questions about how to represent a list as a graph in R. My list is of the following form:

```
str(sample(as.matrix(1:3),1000,replace = T))
```

 I created a matrix from the elements of my list:

```
dim(sample.matrix(as.list(sample(as.matrix(1:3),1000,replace = T))))
```

```
[1] 1000 3
```

 I'd like to create a graph, like this: $g =$

```
as.graph(sample.matrix(as.list(sample(as.matrix(1:3),1000,replace = T))))
```

 plot(g) Is it possible to do? If not, what is the best way to

represent this list as a graph? A: You can do this:

```
graph(as.matrix(sapply(sample(as.matrix(1:3),1000,replace = T),
```

```
function(x) 1)))
```

 We use sapply to turn the list into a matrix. Then we
